        </div>
        <div class="content">
            <p>Forest fires are a major environmental issue, creating economic
and ecological damage while endangering human lives. There are typically about
100,000 wildfires in the United States every year. Over 9 million acres of
land have been destroyed due to treacherous wildfires. It is difficult to
predict and detect Forest Fire in a sparsely populated forest area and it is
more difficult if the prediction is done using ground-based methods like
Camera or Video-Based approach. Satellites can be an important source of data
prior to and also during the Fire due to its reliability and efficiency. The
various real-time forest fire detection and prediction approaches, with the
goal of informing the local fire authorities.
            </p>
